

Wireless Access

Extending our MPLS to the most difficult to reach locations

Unreliable, unsecured network connections for remote business locations can slow and restrict business operations. Now, you can extend your secure connectivity to all of your locations.

Why Segra Wireless Access

Whether your employees are in the field temporarily or permanently located off your fiber MPLS, Segra Wireless Access provides the connectivity they need to get their work done. The same rules, priorities, policies and applications as your primary network can be seamlessly extended over LTE to your Wireless Access solution.

Whether you need a single data connection to a remote ATM or to support heavier usage with the voice, data and internet traffic of a remote office, Segra Wireless Access keeps your business up and running.

We partner with the top national carriers and provide dual SIM capabilities for a separate primary and secondary connection, giving Wireless Access optimal LTE signal strength.

Features and Benefits

- **Multi-carrier options** allows you to choose the best providers for your primary and secondary signals.
- **Automatic failover switching** to a secondary carrier maintains your connection without disruption or downtime.
- **Private wireless connection** to the Segra network keeps your systems and data secure at all times.
- **24/7 monitoring and management** ensures your wireless access device is always up and running.

Specifications

Available throughout the Segra footprint

Segra Managed Router and Segra WAN (DIA or MPLS) is required at the on-net location

Select your preferred carrier(s) prior to installation
